

IoC #1 – SHA-256 File Hash

Field	Information
IoC Type	SHA-256 File Hash
SHA-256	275A021BBFB6489E54D471899F7DB9D1663FC695EC2FE2A2C4538AABF651FD0F
File	EICAR test file
Tool	VirusTotal
Detection	65/67
Threat Classification	EICAR antivirus test file
Detection Method	SHA-256 hash lookup
Why It Is Relevant	Demonstrates how a known file hash can be used to identify a potentially threatening file
Actual Malware?	No — EICAR is a standardized antivirus test file
Evidence	VirusTotal screenshots
Supporting Source	EICAR official documentation

Screen shots:

The screenshot shows the VirusTotal analysis page for a file. At the top, a large red circle displays the detection score '65 / 67'. Below this, the 'Community Score' is shown as '3794'. The file's SHA-256 hash is '275a021bbfb6489e54d471899f7db9d1663fc695ec2fe2a2c4538aabf651fd0f', and its size is '68 B'. The last analysis was performed '6 minutes ago'. The file is identified as 'eicar.com-22783'. Below the file information, there are tabs for 'DETECTION', 'DETAILS', 'RELATIONS', 'BEHAVIOR', and 'COMMUNITY' (30+). The 'DETECTION' tab is selected. A banner encourages joining the community for more insights and an API key to automate checks. Under 'Code insights', it explains that EICAR is a test string used to detect and test antivirus software, and it's not a real virus. At the bottom, there are 'Popular threat label' (virus.eicar/test), 'Threat categories' (virus, trojan), and 'Family labels' (eicar, test, file).

Field

Information

IoC #2

Malicious IP Address

IP 185.92.190.216

Port 8896

Associated Threat Cobalt Strike

Threat Type C2 / Botnet

Source ThreatFox

Detection Method IP reputation lookup

VirusTotal IP address search

Confidence 75% in ThreatFox

Security Significance Could indicate communication with Cobalt Strike command-and-control infrastructure

If opencti were to be implemented within this project, I would:

1. Deploy OpenCTI with Docker
2. Configure two connectors

A connector can **import external threat intelligence** into OpenCTI or **enrich existing indicators** with information from another service. The focus would be on two connectors.

Connector #1 — MITRE ATT&CK

to populate OpenCTI with:

- Threat actors
- Techniques
- Software
- Attack patterns
- Relationships

Connector #2 — threat-intelligence source

For example, MISP is supported by an OpenCTI connector and can synchronize MISP events/attributes into OpenCTI as STIX 2.1 objects.

Next would involve a creation of an **observable/indicator** representing the hash used as IOC #1. I would also add IOC #2 as an IPv4 observable/indicator and associate the intelligence found with the chosen IP.
