

Access Control Model — DAC

The project will use **Discretionary Access Control (DAC)**.

Under DAC, the owner of a resource can determine which users or groups are permitted to access that resource.

For example, the framework's configuration files and reports can have permissions that restrict access to authorized users.

Access Control List (ACL)

An ACL will be used to control access to sensitive project files.

Example resource:

/reports/

Proposed ACL:

User/Group	Permission
security-admin	Read / Write / Delete
pentester	Read / Write
analyst	Read
unauthorized users	No Access

User Access Level

The project will implement a **Security Administrator** access level.

The Security Administrator will have permission to:

- Configure the penetration-testing framework
- Manage security-testing targets
- Modify scanning configuration
- Manage users and permissions
- Access all generated reports
- Maintain the Docker testing environment

The administrator should not automatically receive unrestricted access to systems outside the authorized testing environment.

Example access hierarchy

Security Administrator

Pentester

Analyst
